

# Healing Garden and Storm Water Infrastructure Project

We are doing our part to improve the water quality of the Patapsco River and the Chesapeake Bay by installing 14 storm water rain gardens. Combined, the rain gardens will treat over 5 million gallons of storm water each year. Over 40,000 native shrubs and perennials will be planted to assist with the filtration of storm water. To bridge the relationship between healing and nature, we are installing an expansive healing garden on our waterfront lawn.

We appreciate your patience while we improve our campus and help protect the environment.

*“Healthy environments create healthier communities.”*
